Vision Restoration Therapy Testimonials

Our Mission –

Improve the quality of life for patients with neurological vision loss and their families.

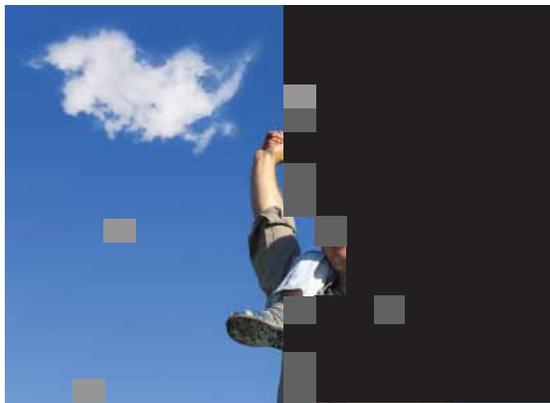

What can NovaVision's Vision Restoration Therapy (VRT™) do for you?

VRT can help restore your life back to a more normal state by giving you a portion of your vision back and take you from...

this

to

this!

Pre-VRT

Post-VRT

Individual results vary.

Inside are just some of our patient testimonials along with their actual visual field results. Let VRT help YOU get your life back just as these patients did. 88% of patients surveyed reported a significant improvement in at least one area of their daily lives. 1

1. Mueller I. et al. Visual Impairment Research 2003; 5:157-178
(NovaVision-sponsored Study)

INTRODUCTION

This booklet contains visual fields of Vision Restoration Therapy (VRT) patients upon initiation and completion of VRT as well as personal experiences. The testimonials included are approved excerpts received by NovaVision, which are on file at NovaVision's offices in Boca Raton, Florida, USA or Magdeburg, Germany.

The charts shown in each testimonial display the results of NovaVision's visual field tests, which are performed before starting VRT and at the end of six months therapy. During a test, light stimuli are presented in each of the grid boxes and the patient responds when they see these stimuli by pressing a button. Three tests are carried out and the results are overlaid. A white box indicates that the light stimulus was seen in that box in every test. A black box indicates that no light stimuli were seen in that box. A gray box indicates that patient has seen stimuli in one or two out of the three tests.

The percentage improvement is a calculation based on the number of stimuli patients saw upon initial examination before therapy compared to the number seen upon final examination.

Damage to the visual field is different in each case. Results vary and those for one patient should not be viewed as typical or taken as an indication of a likely result for a different patient. Outcome studies have shown an average visual field border shift of 5 degrees of visual angle.

Hemianopia: Loss of one half of the visual field

Quadrantanopia: Loss of a quarter of the visual field

Scotoma: Blind spots/islands of lost vision

“On or about March 27 of 2013, I suffered a massive heart attack. On or about that 20th , I suffered a major stroke then robbed me of my vision. I lost about 50% of my vision in both eyes. In effect, I was almost totally blind on my right side. And so, my quest for a solution began.

I met with the neurologists at one of the best hospitals in the US, but heard nothing but bad news. The stroke had damaged a part of my brain that controlled this particular vision path. I was told that there was nothing that could be done and that I should consult a neurological ophthalmologist. Seven weeks later when I was released from the hospital, I started searching for a doctor who could help me regain my sight. Every doctor gave me the same story: “There is nothing that I can do” Feeling discouraged, but not ready to give up we continued our quest.

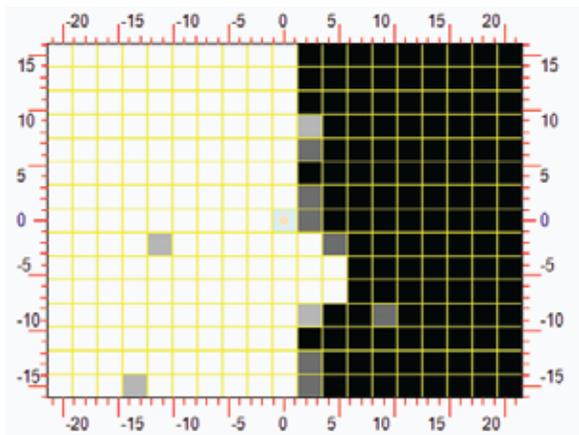

It was then that my dear wife heard about NovaVision. I was able to find a practice that could perform the evaluation that NovaVision required in order to create a therapy tailored to my condition and needs. It should be noted that even though the doctor performed the required tests, she held little hope that the therapy would work. Undeterred, we ordered my NovaVision therapy. I spoke with Alex at NovaVision and she was very encouraging, She made no promises, but rather pointed to the success of others. With nothing but my vision to gain, I was up for the challenge. In the weeks and months to come, Alex and the NovaVision staff kept in contact with me to inform me of my progress and to offer encouragement and support.

My equipment arrived within a few days. It was very easy to set up and to use. At first the recovery was slow for the first 4 months, we saw little improvement. Then all of a sudden, my vision started to improve. By the end of the 6 month of treatment I had recovered 60% of my lost vision and the improvements kept coming.

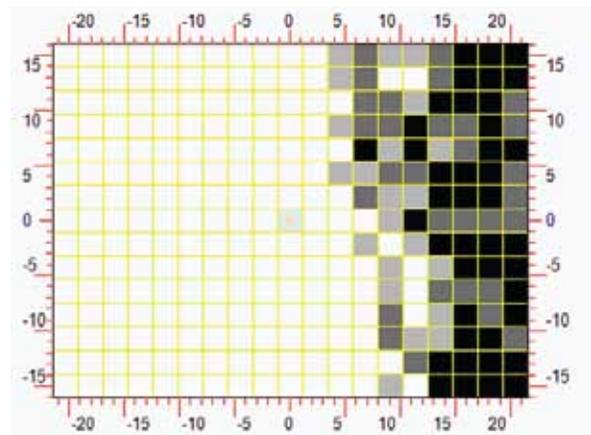

To make a long and scary story short, I am able to safely drive again. My visual field is still improving every day and I have my independence and life back. I am on a quest now to see to it that every medical professional with whom I come in come contact hears about NovaVision.

Thank you Alex, Cristina and all the fine staff at NovaVision for your product, support and encouragement. You know, Mom was right; you only get one pair of eyes, take care of them. I thank the Lord and NovaVision for giving me my sight back!”

Paul - Connecticut, U.S.

Post-VRT

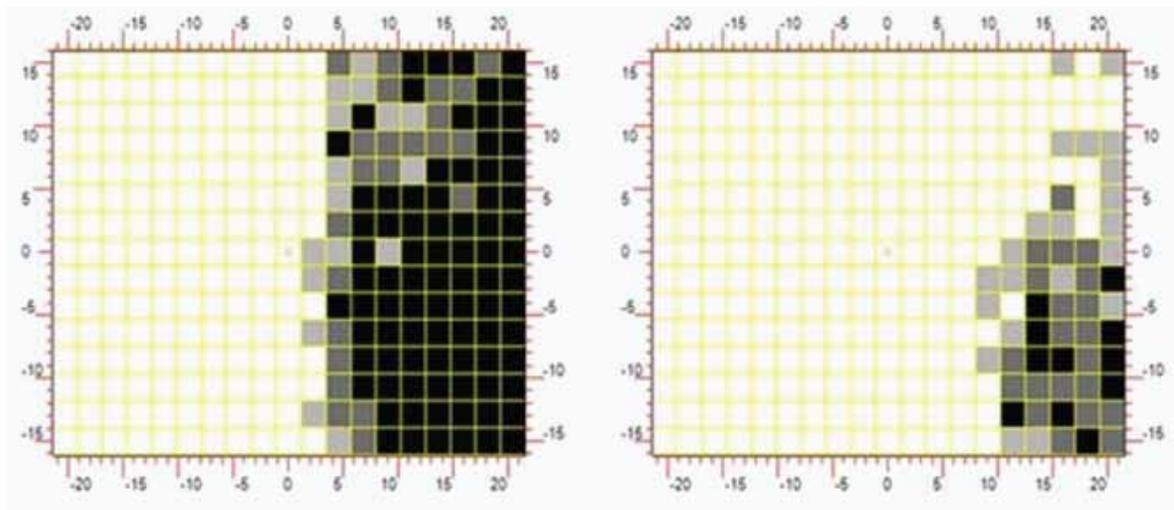

Vision Restoration Therapy (VRT)

"On 10/10/10 I was Involved in a motorcycle accident; the police reported me as a fatality, but I fooled them. Unfortunately I suffered from vision loss attributed to homonymous hemianopsia. After being seen at a prestigious local hospital by the Clinical Professor of Ophthalmology & Visual Science and Neurology, he told me I would never improve and to become accustom to my vision loss.

My Family researched therapy options and we insisted on trying NovaVision. The unit was easy to set up. I meticulously followed the instructions. Vision is so important; I believe I had to give it my all to get as much of it back as I possibly could. I continued the therapy for several months and only stopped once my therapy advisor and I believed I achieved the maximum vision improvement. I am actually surprised this is not the generally accepted treatment like other physical therapies are. Before NovaVision everything was difficult such as, reading, cooking, walking stairs, all the simple like things. Now I have a new job, I ran my first marathon and finally published a book.

Life is a challenge, but I do believe I accomplished all these wonderful achievements because I found NovaVision and did the daily exercises and monthly tests I needed to do. The wonderful encouraging support I received made the hard work easier."

Carole Urban- Connecticut, U.S.

Pre-VRT

Post-VRT

"In March 2005, I had a major stroke on the right side of the brain, rendering the left side of my body weak and paralyzed. The stroke really impacted my vision. Reading became very difficult because I could not easily see where the line of text began on the left. I would misread price tags when shopping because I couldn't see the numbers on the left. \$29.95 would look like \$9.95. I became startled when people would approach me from the left side because they seemed to suddenly jump out at me.

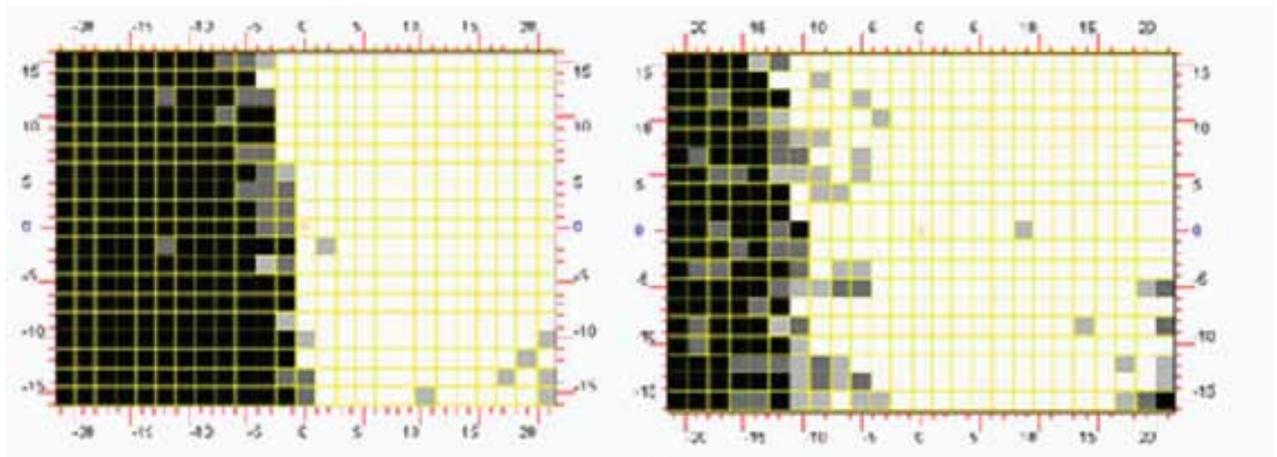

I learned about VRT from someone who suffered from a stroke and benefited greatly from NovaVision. The doctor who had recommended that therapy to that patient was tentative about the treatment. I settled into a routine of doing VRT twice a day, half an hour at a time. It was psychologically good for me to be working on something at home. It helped to get monthly results from NovaVision to check my progress. I also listened to music to make the time go by faster.

After VRT, my reading is much better and scanning a computer screen is much easier. I can ride a bicycle now with confidence and now I don't have to concentrate as hard to see on the left. I still have to scan the environment a little, but I am more comfortable getting around. Because of VRT, I do not feel startled so often.

I am enthusiastic about my results from VRT. I know VRT is responsible for the improvements I've had in my vision."

Vision Restoration Therapy (VRT)

"In July 2006, I was in a motorcycle accident near my home. About one year later, I noticed that I had vision loss. As a result, I was not allowed to drive and I could no longer golf. I was tripping over everything on my right side.

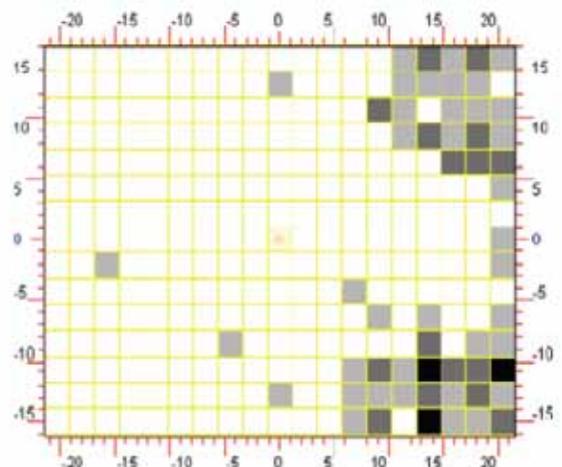

I learned about VRT from my neuro-ophthalmologist, and I gave it a try to improve my vision. The therapy went very well for me, and I notice improvement in my peripheral vision. My doctor has been very knowledgeable, informative and helpful.

After VRT I have regained my ability to drive and golf! I do not trip over anything anymore and all of my ADLs have improved. I attend college and can drive myself there safely. I also navigate the entire campus and buildings including the steps safely and easily. Thank you very much NovaVision."

Pre-VRT

Post-VRT

"I suffered from a hemorrhagic stroke in the left temporal lobe that resulted in vision loss on my right side. I noticed that I had lost some of my vision five weeks later when I arrived home because I was bumping into furniture. My vision loss affected my ability to drive, walk with groups of people, play ping-pong, reading and watching TV.

I heard about Vision Restoration Therapy from a friend who is a neurologist and he recommended the therapy. I decided to try it since a nurse practitioner explained to me the probability of improvement and assured me that I would be a good candidate.

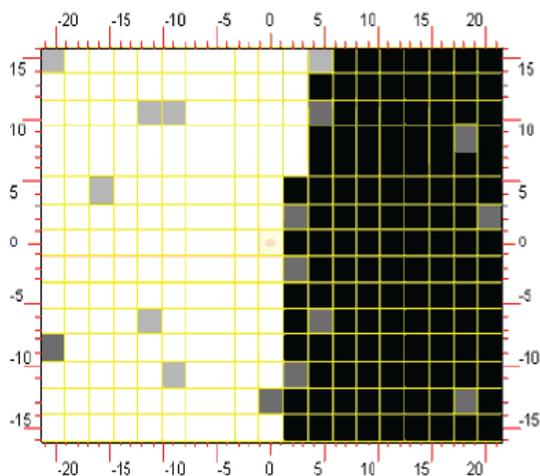

Sometimes I have a hard time fixating and it has taken longer than expected between modules; however, I am encouraged that I can see more on the right. Also, once I decided to pursue the therapy it took a long time to establish a consultation date, but after I finally did everything has been fine.

Things that I can do now include walking among people, using the computer and I can read an entire line better. I no longer knock over glasses or push my food off the plate at meal time.

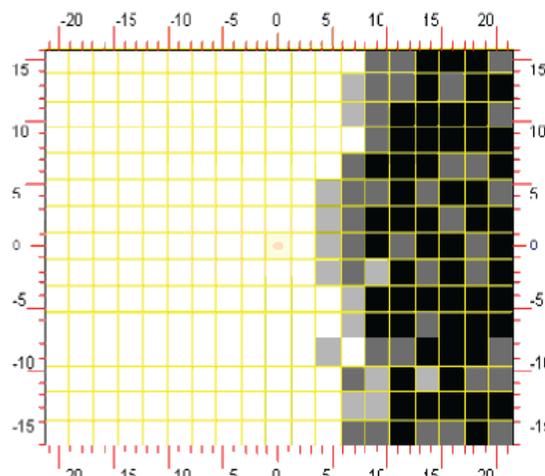

Additionally, I have been concentrating on VRT for six months. Because of aphasia, my reading is very slow and at a fairly simple level. I plan to use my improved vision in an effort to improve my reading ability."

Vision Restoration Therapy (VRT)

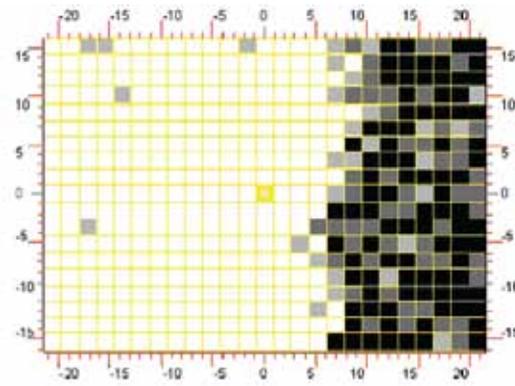

"I had a surgery 6 years ago that caused my vision loss. After three months of doing VRT, I have seen big improvements in my vision. VRT has helped my vision in numerous ways; my reading ability improved, I can scan much better, read at ease, walk with confidence, turn corners much easier, and rarely do I run into anything. I give credit to VRT which has strengthened my vision and helped me drive again. I live a normal and active life now."

Excerpt from broadcast news story –

[Describing her stroke] "Everyday I had a headache; I thought it was related to stress. I did not think to take any precautions, and assumed everything was going to be okay. Next thing you know I had to go to the hospital because I felt so horrible."

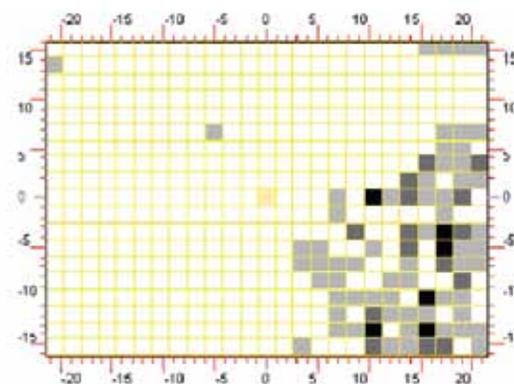

"Before VRT, my vision appeared to be cloudy. Since doing VRT my vision is a lot clearer, and I have a greater awareness of what is going on around me. I am able to walk with more confidence and no longer bump into walls as frequently. I am able to get around the house by myself and even pour a cup of coffee without a spill. Also, I am learning to read again."

Pre-VRT

Post-VRT

“On August 12, 2002, I woke up with the intention of taking a shower and getting ready for work, but I had a headache and noticed the newspaper looked funny when I picked it up off the front porch. I went to my doctor who ordered a cat scan and later informed me I was having a stroke.

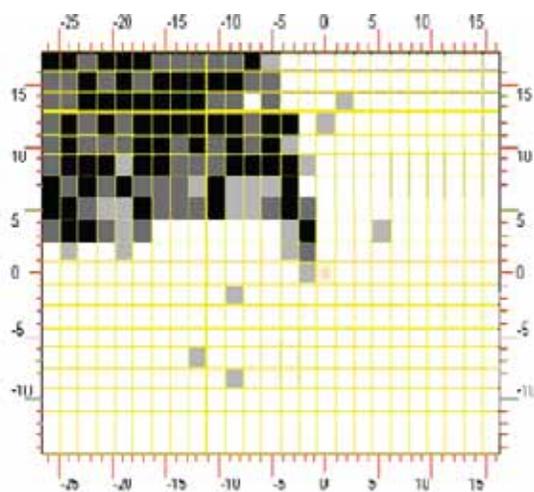

When I first had the stroke, I couldn't see anything from the diagonal left bottom to diagonal right top in my visual field. The area was gray and fuzzy like snow on a TV. After some time, my visual field opened. My vision finally stabilized so that just my upper left quadrant remained impaired.

I learned about vision restoration therapy from an article in the Wall Street Journal and felt I met the description of a good candidate for treatment. While my doctor wasn't yet aware of VRT, I thought the results sounded promising.

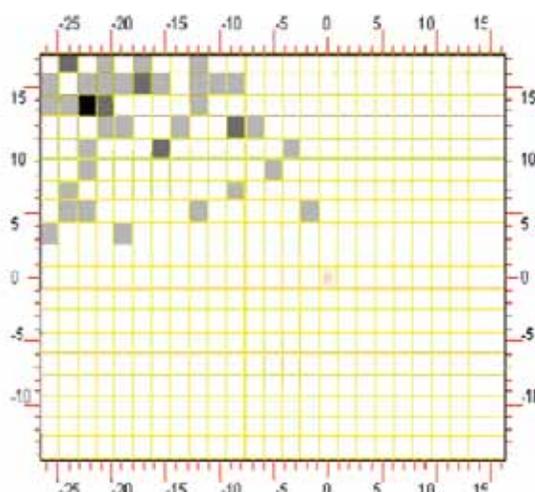

I did six months of therapy and was encouraged by the improvement as I continued. Since I was still improving, I committed to an additional three months. While I didn't benefit as much with the additional therapy, I have the peace of mind that I have done as much as I could to restore my vision. While I still can't see a person's right eye when talking face to face, I can rest easy knowing that I did what I could to improve my vision.

I think VRT is a very valuable treatment. It is wonderful that a treatment is available that can provide you with real benefits. If you feel limited by your vision loss and you know you can dedicate the time to do it right, you should try it. I have since written a letter to thank the writer of the Wall Street Journal article as I wouldn't have learned about the therapy otherwise.”

Post-VRT

Vision Restoration Therapy (VRT)

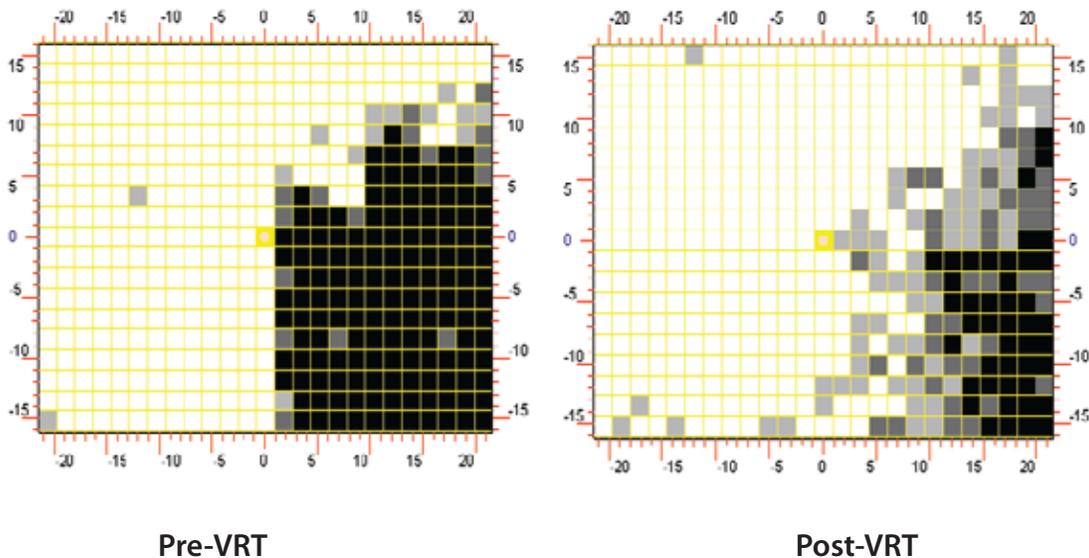

“After my stroke I drove primarily to get to work and see my family for almost two years when the ophthalmologist called me back in for a vision test. My results were just shy of meeting state driving requirements, so he told me I was going to lose my license. My family doctor recommended that I see a neuro-ophthalmologist. The neuro-ophthalmologist came to the same conclusion about my driving and recommended that I use public transportation. Not accepting this as a solution, I scheduled an appointment with a physician to complete a vision exam which showed the same vision deficit.

After learning of my experience, a friend recommended an ophthalmologist who had helped her after she had a stroke. He recommended that I do Vision Restoration Therapy (VRT).

I traveled 150 miles for VRT diagnostic testing and was happy to begin VRT in April 2005. All I was hoping for was to regain my driver's license and be able to drive again to the grocery store, church and the bank. My doctor could not promise me that I could drive again, but I felt it important to give the therapy a try. I completed my daily VRT sessions faithfully and did not deviate from the schedule. NovaVision worked with me and indeed, I did complete it with success.

On June 2, 2006, I received notice that I had passed the state vision test and I got my driver's license back. A whole new world has been opened up to me again, and I feel reborn with the freedom to get around and the ability to see better. I can also go to the theater or symphony and clearly see the stage again. My youngest son, a physician's assistant, has told me how impressed he is that I am on the cutting edge of medicine by completing VRT, and that makes me feel good as well.”

GH- Pennsylvania, U.S., 64
14.5% Improvement

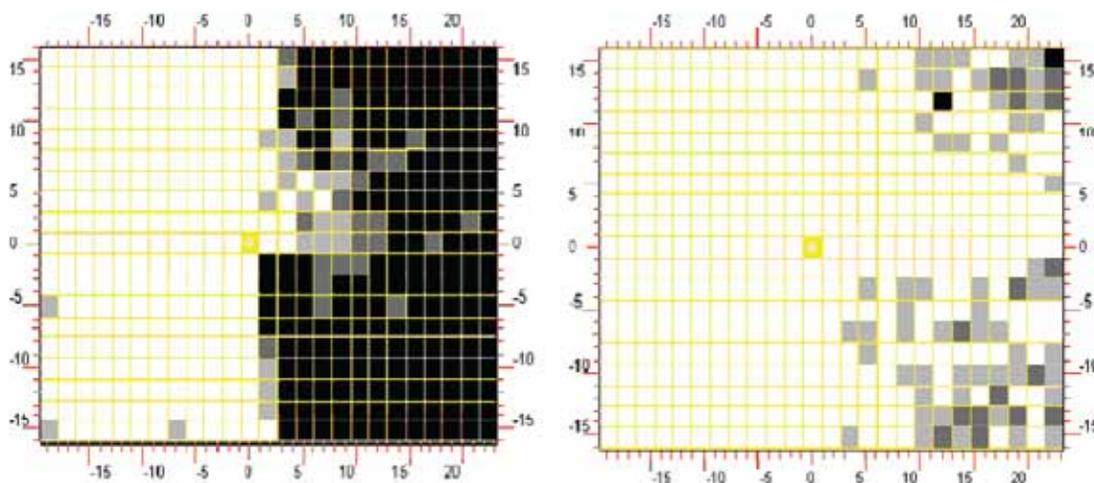

"I lost 50% of my vision on the right side after suffering a severe stroke in 1999 which affected the left hemisphere of my brain. The loss of sight in the lower right quadrant meant I could not read and always had difficulty finding items on my right side.

I performed NovaVision VRT twice daily for nine months – taking the device with me even as we traveled extensively with my husband's job with a cruise line. Although it was difficult at times, I remained committed to the treatment because my results were so good.

My vision improved so I can now read menus at restaurants and directional signs inside airport terminals when traveling. I enjoy watching TV because I no longer miss out on any of the action. I can appreciate my art collection like I could before my stroke. I can indulge in make up, which I can apply myself again. I seldom lose my lipstick on the dresser even if it is on the right side. Thank you, NovaVision, for restoring my vision and for coloring my world again.

I highly recommend VRT as a safe and effective treatment. I'm convinced that any patient who diligently sticks to the instructions will have improvement in their vision. I'm eternally grateful for this scientific breakthrough in vision technology."

Vision Restoration Therapy (VRT)

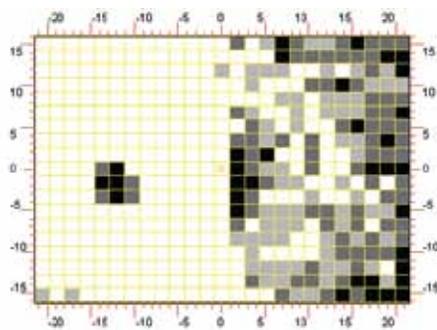

"Before my stroke, reading was my life – both my job and my full-time pastime. After my stroke, I had so much trouble reading... Putting letters together to form words was such a challenge that I quit trying. (Once I could not get the meaning of 'o-f-f')."

I decided to try VRT when my doctor noted the lack of rehab programs for stroke victims left with my sight problems. I was also told that there could be some natural improvement in my vision field without VRT, or during the VRT course. VRT went swimmingly at first. I began the two-a-day sessions on Jan. 11, 2006, but because of changes in my home life, I was not able to stay on the designed six-month schedule. It took months longer. Despite that, because of improvements in my sight I eagerly signed up for a therapy extension.

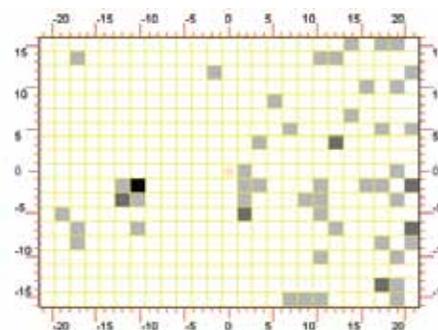

Now, after nine months of VRT and two years after the stroke, I can read at fair speed and comprehension, although still not with the speed and comprehension necessary to return to my work as an editor at The Associated Press.

I estimate that my vision has improved 70 percent as a result of Vision Restoration Therapy. I look forward to my next vision exam. Any stroke victim with my visual problems should try VRT, especially if there's strong home support, or no strong home distractions."

"I had a stroke in 2002 that left me with a scotoma in the center of my vision field. I was not able to read, write and could only see part of the TV screen for two years until I did NovaVision VRT.

I learned about NovaVision from my ophthalmologist and I am very happy that I did the therapy. It truly restores vision. Once I started doing the therapy and realized that it was working, I actually looked forward to doing VRT.

After 12 months of therapy, I could read large print books. I have been able to return to playing tennis and golf. I feel like NovaVision VRT gave me my life back, and I would tell anyone with a visual field deficit considering therapy, "How could you not do it? It really works."

SS- Ohio, U.S., 58

Pre-VRT

Post-VRT

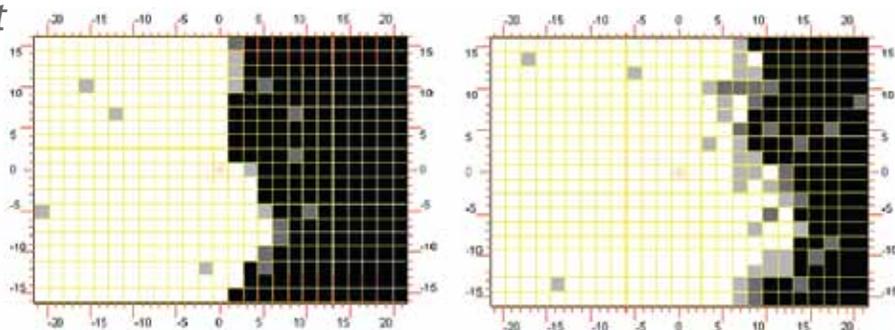

"After my stroke I lost about half my field of vision, and since starting VRT I have noticeable improvements in my vision – I see more, it's easier to read, I can see the entire TV screen when watching TV and even enjoy going to the movies now.

As a post-stroke VRT patient with a hemianopia, I encourage others who also suffer from this or other vision loss after stroke to absolutely do it. You have nothing to lose and VRT works. As a retired physician, I recommend other medical practitioners and rehabilitation specialists to advise their stroke and brain injury patients about the benefits of VRT.

I am optimistic by the promise that VRT holds. I was told there was nothing I could do about the vision I lost from my stroke. Fortunately, I discovered NovaVision VRT."

Vision Restoration Therapy (VRT)

"My vision began coming back after the first month of NovaVision VRT, which really surprised me. With each month of therapy, I kept getting better. Now, after several months of therapy, my general vision seems to be back to normal. I passed a driving test, and now I am able to drive safely and without difficulty. My grandchildren are allowed to ride with me again. I feel really lucky to have regained so much vision, particularly since I was told I had lost it for good. I feel so much better than I felt a year ago when I felt I was at my worst, and my vision is still improving. It is amazing how much VRT has helped me.

After VRT, I am more comfortable going places and I can read normally now and enjoy the newspaper. I have returned to my favorite hobby of rebuilding my three cars, including a 1940 Ford, and driving my boat at the lake. I feel like I'm back to normal."

From BG's Caregiver—

"Three years after our son's traumatic brain injury, he began NovaVision therapy in hopes of improving his hemianopsia and right side neglect. Within a month he noticed improved concentration and mental focus. After finishing therapy he was reading more fluidly and easily; also, generally navigating better in the world, improving his catching and dribbling of a basketball. He tested as 'no longer A.D.D.' after therapy, an unexpected bonus. It has added substantially to his independence and quality of life. VRT increased my son's attention span. VRT has so helped my son's ability to navigate his surroundings that he recommended it to his girlfriend, who now is a VRT client."

BG- New York, U.S., 23

Pre-VRT

Post-VRT

"I had a stroke in 1999 which significantly affected my eye sight in my left eye. As a result, I could no longer drive, and I became used to running into the left side of a door frame. I couldn't see very well.

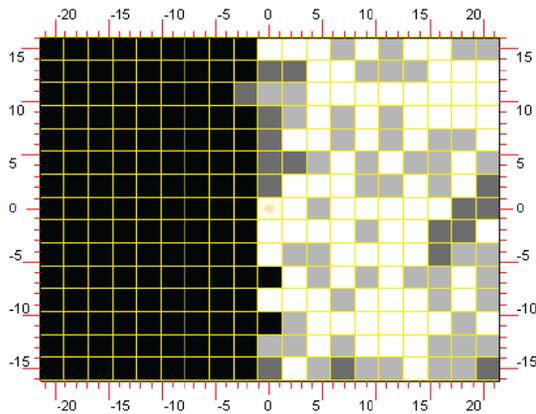

I learned about NovaVision from an article in the Wall Street Journal that my dad sent to me. I contacted NovaVision quickly after reading the article.

The prospect of regaining my eye sight motivated me to do VRT. My primary goal for therapy was to regain my ability to drive. It is quite restrictive not being able to drive, and I wanted my independence back.

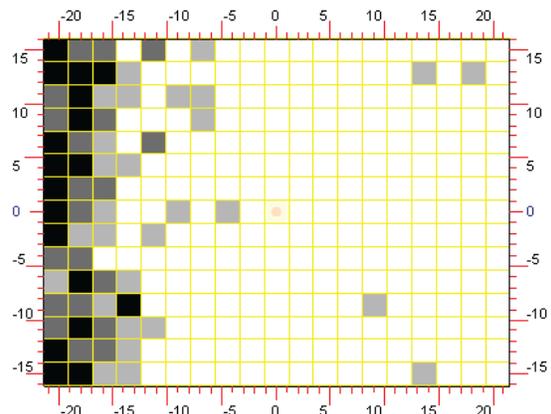

As a result of nine months of VRT, I have regained eye sight in my left eye. Although I cannot yet drive again, I recently passed an eye test at DMV. Regardless, VRT was worth the effort because my day-to-day activities have become so much easier.

Now I don't run into doors as frequently. I can see things that I couldn't see before. I have returned to reading the newspaper and magazines daily."

Vision Restoration Therapy (VRT)

"I was in a bad car accident six years ago. As a result of the head-on collision, I suffered many injuries, and my vision was severely impacted. I became completely blind in my left eye and could only see 50% out of my right eye. I lost all peripheral vision.

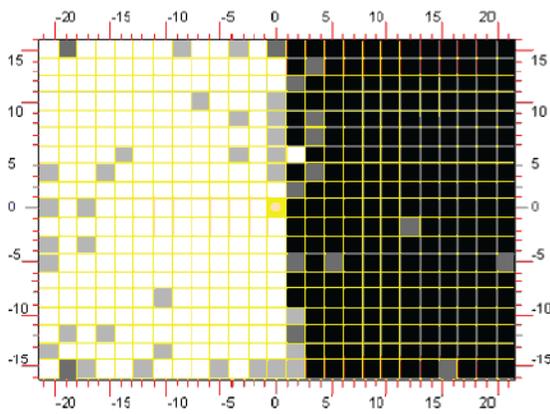

I learned about Vision Restoration Therapy (VRT) from my bishop who printed off several pages about it from the Internet. Three years after my injury and after a lot of other rehabilitation, I was ready to begin therapy.

Before VRT, I remember trying to read along and sing from the hymnal at church. I eventually gave up because I couldn't see well enough to read fast enough. At my job as a childcare provider, I had to walk so slowly to make sure I didn't bump into the children around me.

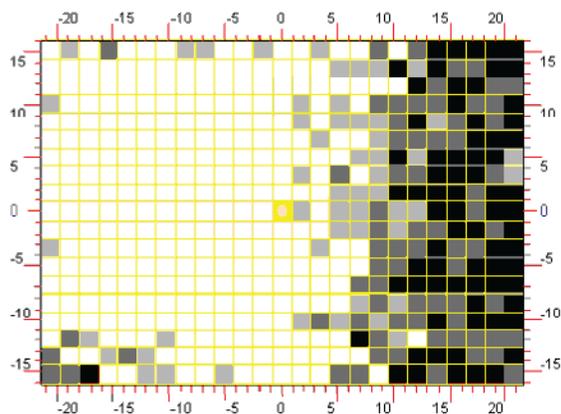

VRT opened up so much more of my vision for me. I went from seeing 50% to seeing 70%. I can now enjoy walks with my husband and play with my daughter. The 20% improvement made a big difference to me. I gained so much from vision restoration therapy.

Doing therapy is challenging, but if you want to try to gain back part of your vision, you should go for it. If you look at my final evaluation, you will see that the left side that was formerly blacked out is now seeing a lot more. VRT is a wonderful therapy."

In a letter to NovaVision –

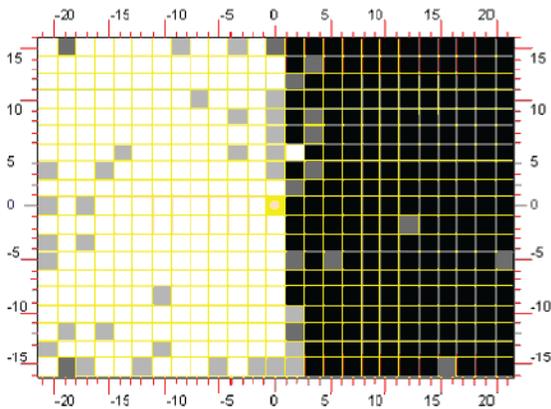

"I want to express my appreciation to your organization for the opportunity to participate in the NovaVision VRT eye program.

As a physician, I was taught that central nerve injury could never be repaired. The improvement in my peripheral vision is truly amazing and has afforded me activities that I would not have attempted previously – such as driving a car which has returned my freedom of movement. For about three months into the program I noticed no change but then I became aware that I was seeing dots to the left that had previously been out of range. I also tested myself on objects in my area and observed an extension of vision to the left. VRT has even helped my golf which, as the ad says, "is priceless."

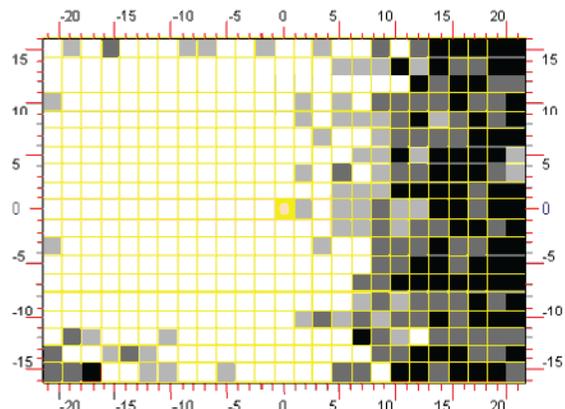

To say that I have been thrilled by this benefit of therapy would be an understatement. I want to thank all those in your organization for making this miracle possible."

Post-VRT

 *"6 years ago I lost vision in my right eye. It was black optic nerve stroke. Doctors said I'd never see again out of that eye. But unwilling to give up I discovered NovaVision on the internet. And asked to be put in a trial case study. With the help of NovaVision I restored my eyesight in my right eye from pitch black to 20/15 in six months. I was amazed. Then suddenly this year June 14th 2015 I woke up with massive blurred vision in both eyes. Unknown cause eye health normal, suspected optic nerve problem. Unable to work put on medical leave but after two months completed NeuroEyeCoach and one month of VRT therapy. I'm happy to say I can drive again and read street signs. And even information on products that small lettering. I am so thankful without NovaVision in my life. I'd been half blind. But amazingly enough I'm completely getting my vision back once again. Every day it's clearer and I will be returning to work soon. Thank you to NovaVision. You have saved my eyesight twice in my life."*

Annette- Michigan, U.S.,

 *"In January 2008, I had a fluke brain aneurysm caused by an arteriovenous malformation (AVM). The results were, 2 strokes, and I went completely blind. Life after a stroke is hard enough, then add not being able to see, on top of that makes life, well, not worth living.*

My entire independence from that day forward, was gone. I needed assistance with everything I did, walking, brushing teeth, and showering, etc. To give you a hint as to what life was like, just close your eyes and try to perform your daily tasks. I would constantly walk into everything and the hardest challenge I faced was, not being able to see my family ever again. It was the saddest point I could ever encounter.

After doing a Google search, I discovered NovaVision. I started performing the NovaVision VRT therapy around August 2008. They recommended I did two, 30 minute sessions twice a day.

As I performed the daily sessions, my vision was starting to get sharper, and the blurriness was beginning to clear. (The blurriness is similar to looking through fog). The vision sharpening, takes time. And the sharpening changes that occur in your visual field are extremely small. So small, that you will not be able to tell the difference from 1 day to the next. After performing the VRT therapy for roughly two years, I woke up one morning, and my vision was pretty much restored to the state it was before my vision loss occurred.

After vision loss happens, there is nothing that can be done to restore vision. No available treatments or surgeries. Performing this VRT therapy is physically harmless to your body. It is basically "light therapy" that is performed from your computer in the comfort of your own home. At any given time that you wish!

I am so happy that a company like NovaVision exists. And my quality of life has enhanced dramatically, to the point where I even drive a car now!

Nothing in my life would be possible, if it wasn't for NovaVision."

Dan Burke- Michigan, U.S.,

 *"18 months ago I suffered 2 strokes that left me unable to see on my lower right side. Suddenly, my life became complicated and it felt like everyone was watching to see what I could and could not do.*

When I went to my doctor he told me to do a driving retest. I was devastated. And I kept hitting my hands and body on objects. My balance was poor as I walked. My overall my vision was different. If I held my right hand and arm up in front of my eyes and slowly pulled my arm back to the right, the effect was like a drawer closing. My hand and arm would disappear as I moved it to the right. I hit my right hand on so many things ... like the underside of a table in a restaurant. I would crack the right side of my right hand on pot edges, vases and cups when I washed dishes and it hurt. I would walk into the window of my car door and the sides of the seats in a theatre. I would bump my right hip on the corner of my island in the kitchen.

Other examples of how my activities of daily living were affected were the food would fall off my fork as I ate, I had trouble writing. In fact everything on the right seemed to be getting darker. It was very frustrating and scary and as a result the backs of my hands, the underside of my lower arms and my shins were all bruised.

7 months after my stroke I discovered NovaVision. I heard about this company by reading a book about neuroplasticity. They claimed to be able to help people who had suffered a stroke to regain some of their lost vision. I began Vision Restoration Therapy and my results were immediate and dramatic. In the first month of therapy things got brighter and slowly, month by month, I stopped hitting myself so much. My writing improved because I could see all around my fingers. My balance improved and best of all, I took 3 driving lessons and passed my driving test!

My results are not perfect; the vision on my right is fainter and not as sharp and clear as on the left, but I can now see on both sides which is something I was not able to do before Vision Restoration Therapy.

I am delighted with my improved vision and I am very grateful to NovaVision. There is now more quality back in my life and I feel so much happier."

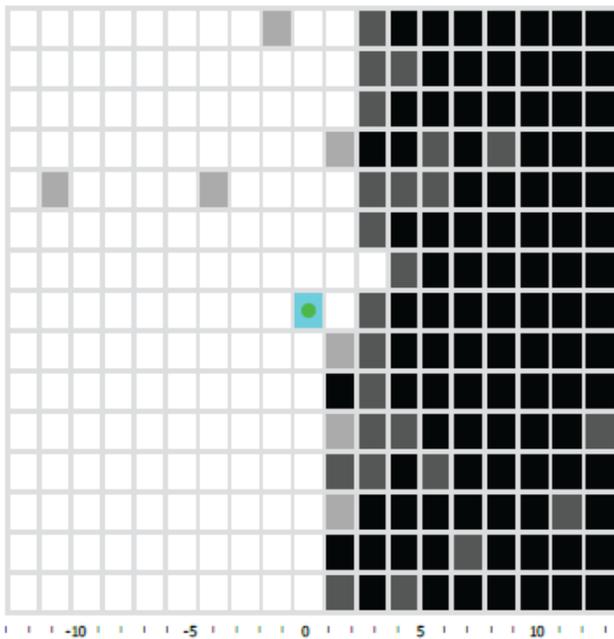

Judy U. - [Canada](#)

Vision Restoration Therapy (VRT)

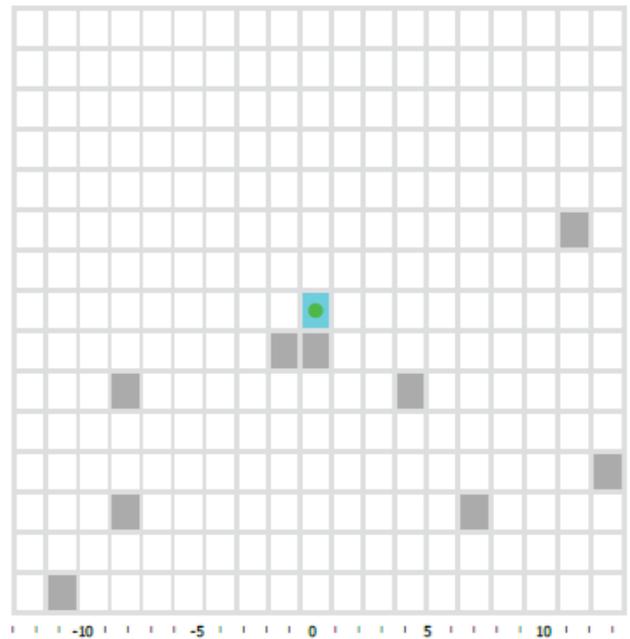

"In May 2016, I suffered a stroke while driving. I lost vision in my right eye. My doctor told me it was not safe for me to drive. He wrote a prescription for NovaVision and said the program may help to restore my vision. I had to overcome a few problems before I could start. First, I had a Mac Book Pro and the program only ran on a PC. I got a program (parallel desktop) and partitioned my hard drive. It worked, so could start.

Second, we were in the middle of moving house making it hard to do the therapy. With the help from their tech people and Cristina Racasan things came together. My vision improved as I used the program. After several months (6) my ophthalmologist told me he thought my vision had improved enough to drive. I had to pass a Virginia Test which included, vision, reaction time, multi-tasking, and an on the road driving test. I am now driving. My doctor said he thought the therapy has helped. I still have work to do, but I am going to take follow-on therapy. Bottom line: Cristina was always a phone call or e-mail away to help when I had a problem, my vision has improved and I can drive."

John H.- *Virginia, U.S.,*

Pre-VRT

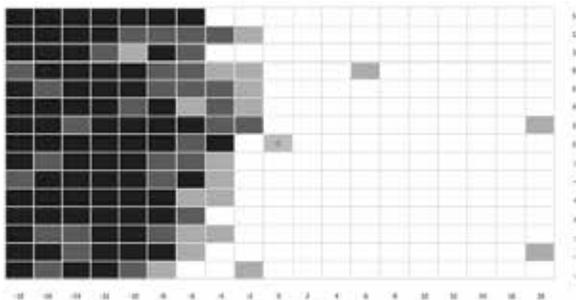

Post-VRT

After a stroke I experienced a visual field defect to the left. It was a hard time only being able to see “half the world”. My wife searched the Internet and miraculously found NovaVision. So we got in contact and received a very friendly and complete consultation from the team in Magdeburg. I did the NeuroEyeCoach therapy and then 6 months VRT and am currently doing a 3 month extension. All the therapies have shown to achieve notable improvements/results. The visual field defect is largely regressed. Many things have become more comfortable and I have gained back a large piece of my attitude towards life. It took an appreciable amount of time to perform the training, but the reward is the gratification. I have re-entered my world. I can be out and about in town on my own, I can ride the bike, orientation is better and a lot more. Reading is also better because I do not miss the beginning of the line any more. My confidence in life is back – I am happy with myself.

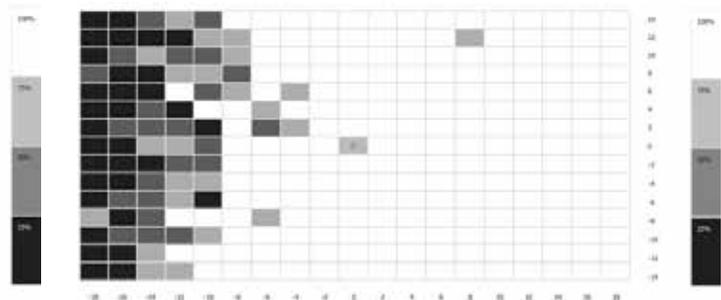

A big thank you to NovaVision in Magdeburg and particularly to the clinical services team. The care I received was one-of-a-kind and I am very thankful for that. If only for the super support I received I will continue my therapy at a later point in time.

I highly recommend the therapies offered because they were successful. It is very unfortunate that the medical insurances do not cover the costs.

Volkmar H.- [Dresden, Germany](#)

Pre-VRT

Post-VRT

 *"After my stroke in April 2017 I had suffered from a visual field defect to the left that restricted me tremendously. In the rehabilitation clinic I started working with a NovaVision program. Afterwards I started a therapy with a different provider, but felt not really looked after. I then contacted NovaVisionand performed Vision Restoration Therapy for half a year two times per day.*

Through the whole time I received very good service and was well cared for. I noticed considerable improvements. Two independent visual field tests (at the eye doctor and the clinic) confirmed these improvements. To my surprise the defect decreased even in the far left periphery, even though this area was only "touched" by the stimulated region on the PC-screen.

I have achieved my goal: I am allowed to drive again, and I don't feel restricted or impaired any longer! I recommend this therapy to everyone, costs and efforts have really been worth it."

Max D. - [Bavaria, Germany](#)

NeuroEyeCoach Testimonials

Let's Create a New Vision Together

"After several levels of NeuroEyeCoach, I was a much safer driver. I saw pedestrians more quickly, navigating the grocery store shelves was more successful, I could find the birds in my yard faster. I feel more confident and safe with my improved ability to see more while also having a heightened awareness of my surroundings.

I can't put a value on what I have gained with NeuroEyeCoach, I can just say thank you with all that I am."

Luree- Virginia, U.S.

"Several years ago, I suffered a traumatic brain injury as a result of a motorcycle accident which resulted in a percentage of peripheral vision loss. After completing NeuroEyeCoach therapy I did notice improvements, such as regularly locating items in my vision loss field and better motion navigation, so I do not bump into obstacles as often.

I believe NeuroEyeCoach helped by improving my vision scanning frequency, and also creating a broader scale to scan making me more aware of how to see things in the "big picture". I do recommend this therapy. The support team is helpful and encouraging. I believe the product is beneficial to compensating for vision loss."

Carole Urban- Connecticut, U.S.

"I just finished NovaVision's NeuroEyeCoach therapy program, to help tweak my field of vision. By the end of this program, I could tell improvements in "seeing" as I went about my daily routine in the house and on the road. My eyes are now more quickly picking out objects that I may have missed, or been slower to "see," prior to this electronic coaching.

This is the second program I have used from NovaVision. Several years ago, after a stroke cost me my ability to read (a horrible feeling), a neurologist recommended NovaVision's Vision Restoration Therapy. I was reading again at the end of this months-long therapy.

I recommend both programs."

RH- *Florida, U.S.*

"6 years ago I lost vision in my right eye. It was black optic nerve stroke. Doctors said I'd never see again out of that eye. But unwilling to give up I discovered NovaVision on the internet.

With the help of NovaVision I restored my eyesight in my right eye from pitch black to 20/15 in six months, I was amazed. Then suddenly this year June 14th 2015 I woke up with massive blurred vision in both eyes. Unknown cause eye health normal, suspected optic nerve problem.

I was unable to work and was on medical leave but after two months I completed NeuroEyeCoach and one month of VRT therapy. I'm happy to say I can drive again and read street signs and even information on products with small lettering.

I am so thankful! Without NovaVision in my life I'd been half blind. But amazingly enough I'm completely getting my vision back once again. Every day it's clearer and I will be returning to work."

Annette- *Michigan, U.S.*

 *“After a stroke I lost my left visual field. In the rehabilitation clinic I already worked with NovaVision therapy programs and learned that I could continue the vision therapy at home. My eye doctor has also taken a lot of time to explain my different options, has recommended NovaVision therapies to me and helped me to start.*

In April 2016 I started therapy with NeuroEyeCoach, worked very hard and completed the training after about 2 ½ weeks.

NeuroEyeCoach has helped me a lot. After the stroke I had massive difficulties with spatial orientation. When there were many people in a room, I was not able to find my way to entrance and exit. This had already improved a bit over time, but because of NeuroEyeCoach I have no problems any longer. I also get around well in traffic. Before my training I panicked when I was out with my husband, and suddenly he had „vanished“(which means he had walked away a few steps and I did not see him right away). I didn’t know what to do. That is all over now.

I was on vacation just now, and in the dining hall I noticed how quickly I found my way back to the table, after fetching dinner from the buffet. In the rehabilitation clinic there was also a dining hall and it was a huge problem for me each time to get back to my table.

Just today I had a great experience of success: on my own, I took the bus into town for my appointment at the beauty salon! Until now I always needed my husband to accompany me. I was already convinced I could never ever go to town again on my own, just for a stroll or for a cosmetic treatment, what women like to do, but it works!

A stroke is a very bad and frightening event, but I feel I was still fortunate.”

Anita K.- (Saxony), Germany

"In July last year (2015) I suffered a brain hemorrhage. It resulted in a visual field defect to the left, which is limiting me considerably. Since the vision loss did not regress in the six months after the bleeding, I started vision therapy with NovaVision in January this year (2016).

I began with the NeuroEyeCoach program to train faster eye movements, and completed this therapy program a few days ago. I must say that I was skeptical at the beginning that this program might help me, but now experience significant improvements. I can drive my bike again and overall I get along much better. A few days ago I inquired at the supermarket where I could find a particular product that I was looking for. They pointed me to the aisle and shelf, and as I stood in front of the shelf, I found the product immediately. I thought: "This really works, that would not have been possible two months ago. It is almost as it was before.

Now, when I walk down the street, I do my own exercises and pay particular attention to everything that happens on my left side. I see the cars and make myself aware of their colors. So I train my vision in everyday life.

Now after completion of the NEC program I will start with Vision Restoration Therapy VRT and certainly hope for further improvements!"

Wilfred H. - *Niedersachsen (Lower Saxony), Germany*

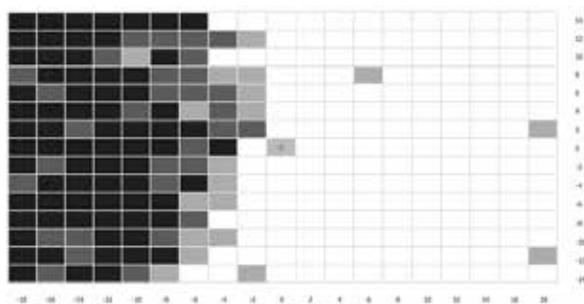

After a stroke I experienced a visual field defect to the left. It was a hard time only being able to see “half the world”. My wife searched the Internet and miraculously found NovaVision. So we got in contact and received a very friendly and complete consultation from the team in Magdeburg. I did the NeuroEyeCoach therapy and then 6 months VRT and am currently doing a 3 month extension. All the therapies have shown to achieve notable improvements/results. The visual field defect is largely regressed. Many things have become more comfortable and I have gained back a large piece of my attitude towards life. It took an appreciable amount of time to perform the training, but the reward is the gratification. I have re-entered my world. I can be out and about in town on my own, I can ride the bike, orientation is better and a lot more. Reading is also better because I do not miss the beginning of the line any more. My confidence in life is back – I am happy with myself.

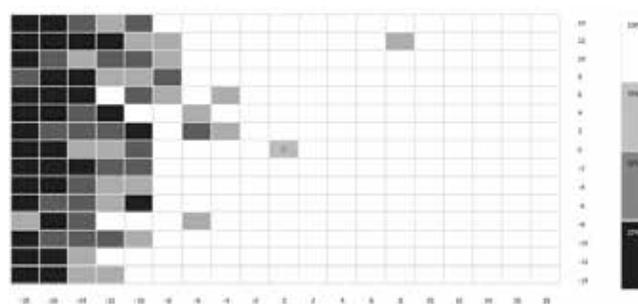

A big thank you to NovaVision in Magdeburg and particularly to the clinical services team. The care I received was one-of-a-kind and I am very thankful for that. If only for the super support I received I will continue my therapy at a later point in time.

I highly recommend the therapies offered because they were successful. It is very unfortunate that the medical insurances do not cover the costs.

Volkmar H.- *Dresden, Germany*
